

You have to include one example that shows how to go from the raw data to the final model, going through all the processes in between.

take one that you like, and do it.

take the data, go to Prosys, generate two output files:

- with filtered data
- unfiltered data

open Res2Dinv, run several inversions

- standard inversion, with the filtered and the unfiltered data
- robust inversion, with the filtered and the unfiltered data

At the end, you will have generated four different final models.
Compare them
